

#### **OVERVIEW OF VLANS**

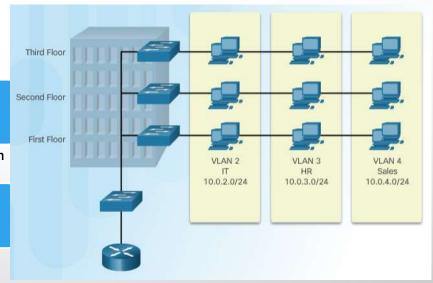

### **VLAN DEFINITIONS**

#### VLANs can segment LAN devices without regard for the physical location of the user or device.

• In the figure, IT users on the first, second, and third floors are all on the same LAN segment. The same is true for HR and Sales users.

#### A VLAN is a logical partition of a Layer 2 network.

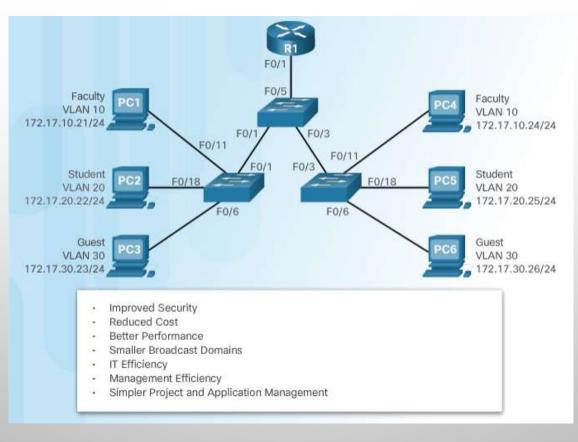

- Multiple partitions can be created and multiple VLANs can coexist.
- The partitioning of the Layer 2 network takes place inside a Layer 2 device, usually via a switch.
- Each VLAN is a broadcast domain that can span multiple physical LAN segments.
- Hosts on the same VLAN are unaware of the VLAN's existence.

 VLANs are mutually isolated and packets can only pass between VLANs via a router.

# OVERVIEW OF VLANS BENEFITS OF VLANS

#### **OVERVIEW OF VLANS**

### TYPES OF VLANS

- COMMON TYPES OF VLANS:
  - DEFAULT VLAN ALSO KNOWN AS VLAN 1. ALL SWITCH PORTS ARE MEMBERS OF VLAN 1 BY DEFAULT.
  - DATA VLAN DATA VLANS ARE COMMONLY CREATED FOR SPECIFIC GROUPS OF USERS OR DEVICES. THEY CARRY USER GENERATED TRAFFIC.
  - NATIVE VLAN THIS IS THE VLAN THAT CARRIES ALL UNTAGGED TRAFFIC. THIS IS TRAFFIC THAT DOES NOT ORIGINATE FROM A VLAN PORT (E.G., STP BPDU TRAFFIC EXCHANGED BETWEEN STP ENABLED SWITCHES). THE NATIVE VLAN IS VLAN 1 BY DEFAULT.
  - MANAGEMENT VLAN THIS IS A VLAN THAT IS
     CREATED TO CARRY NETWORK MANAGEMENT
     TRAFFIC INCLUDING SSH, SNMP, SYSLOG, AND MORE.
     VLAN 1 IS THE DEFAULT VLAN USED FOR NETWORK
     MANAGEMENT.

### Default VLAN Assignment

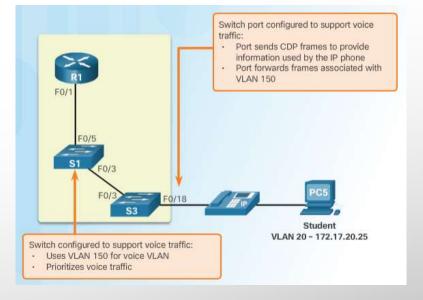

Initially, all switch ports are members of VLAN 1.

#### **OVERVIEW OF VLANS**

### **VOICE VLANS**

- TO SUPPORT TIME-SENSITIVE VOICE TRAFFIC, CISCO SWITCHES SUPPORT A VOICE VLAN THAT REQUIRES:
  - ASSURED BANDWIDTH
  - DELAY OF LESS THAN 150 MS ACROSS THE NETWORK TO ENSURE VOICE QUALITY
  - TRANSMISSION PRIORITY OVER OTHER TYPES OF NETWORK TRAFFIC
  - ABILITY TO BE ROUTED AROUND CONGESTED AREAS ON THE NETWORK.

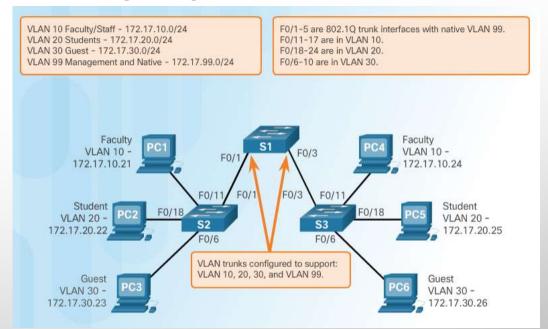

- The voice VLAN feature enables access ports to carry user and IP voice traffic.
  - In the figure, the S3 F0/18 interface has been configured to tag student traffic on VLAN 20 and voice traffic on VLAN 150.

# VLANS IN A MULTI-SWITCHED ENVIRONMENT VLAN TRUNKS

- A VLAN TRUNK IS A POINT-TO-POINT LINK THAT CARRIES MORE THAN ONE VLAN.
  - USUALLY ESTABLISHED BETWEEN SWITCHES TO SUPPORT INTRA VLAN COMMUNICATION.
  - A VLAN TRUNK OR TRUNK PORTS ARE NOT ASSOCIATED TO ANY VLANS.
- CISCO IOS SUPPORTS IEEE 802.1Q, A POPULAR VLAN TRUNK PROTOCOL.

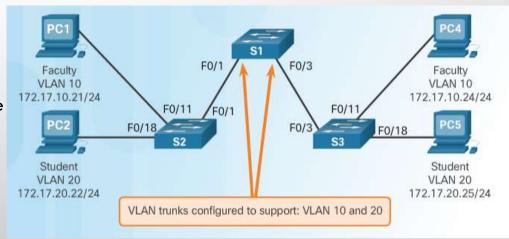

The links between switches S1 and S2, and S1 and S3 are configured to transmit traffic coming from VLANs 10, 20, 30, and 99 across the network.

# VLANS IN A MULTI-SWITCHED ENVIRONMENT CONTROLLING BROADCAST DOMAINS WITH VLANS

- IF A SWITCH PORT RECEIVES A BROADCAST FRAME, IT FORWARDS IT OUT ALL PORTS EXCEPT THE ORIGINATING PORT.
  - EVENTUALLY THE ENTIRE NETWORK RECEIVES THE BROADCAST BECAUSE THE NETWORK IS ONE BROADCAST DOMAIN.
- VLANS CAN BE USED TO LIMIT THE REACH OF BROADCAST FRAMES BECAUSE EACH VLAN IS A BROADCAST DOMAIN.
  - VLANS HELP CONTROL THE REACH OF BROADCAST FRAMES AND THEIR IMPACT IN THE NETWORK.
- In the figure, PC1 on VLAN 10 sends a broadcast frame.
  - Trunk links between S2 S1 and S1 S3 propagate the broadcast to other devices in VLAN 10.
  - Only devices in the same VLAN receive the broadcast therefore, PC4 would receive the broadcast.

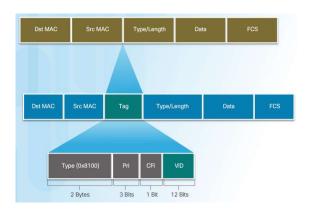

# VLANS IN A MULTI-SWITCHED ENVIRONMENT TAGGING ETHERNET FRAMES FOR VLAN IDENTIFICATION

- BEFORE A FRAME IS FORWARDED ACROSS A TRUNK LINK, IT MUST BE TAGGED WITH ITS VLAN INFORMATION.
  - FRAME TAGGING IS THE PROCESS OF ADDING A VLAN IDENTIFICATION HEADER TO THE FRAME.
  - IT IS USED TO PROPERLY TRANSMIT MULTIPLE VLAN FRAMES THROUGH A TRUNK LINK.
- IEEE 802.1Q IS A VEY POPULAR VLAN TRUNKING PROTOCOL THAT DEFINES THE STRUCTURE OF THE TAGGING HEADER ADDED TO THE FRAME.

- Switches add VLAN tagging information after the Source MAC address field.
- The fields in the 802.1Q VLAN tag includes VLAN ID (VID).
- Trunk links add the tag information before sending the frame and then remove the tags before forwarding frames through non-trunk ports.

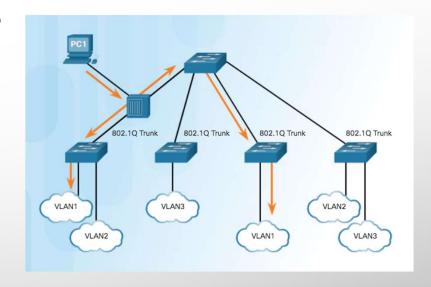

#### VLANS IN A MULTI-SWITCHED ENVIRONMENT

### NATIVE VLANS AND 802.1Q TAGGING

- CONTROL TRAFFIC SENT ON THE NATIVE VLAN SHOULD NOT BE TAGGED.
- FRAMES RECEIVED UNTAGGED, REMAIN UNTAGGED AND ARE PLACED IN THE NATIVE VLAN WHEN FORWARDED.
- IF THERE ARE NO PORTS ASSOCIATED TO THE NATIVE VLAN AND NO OTHER TRUNK LINKS, AN UNTAGGED FRAME IS DROPPED.
- WHEN CONFIGURING A SWITCH PORT ON A CISCO SWITCH, CONFIGURE DEVICES SO THAT THEY DO NOT SEND TAGGED FRAMES ON THE NATIVE VLAN.
- IN CISCO SWITCHES, THE NATIVE VLAN IS VLAN 1, BY DEFAULT.

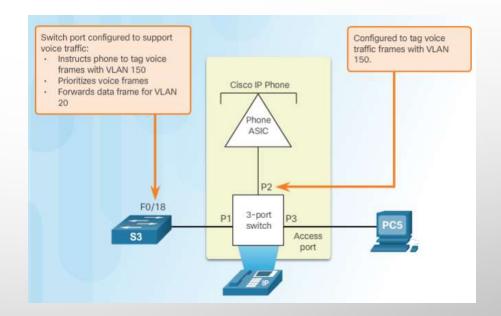

#### VLANS IN A MULTI-SWITCHED ENVIRONMENT

### **VOICE VLAN TAGGING**

- AN ACCESS PORT CONNECTING A CISCO IP PHONE CAN BE CONFIGURED TO USE TWO SEPARATE VLANS:
  - A VLAN FOR VOICE TRAFFIC
  - A VLAN FOR DATA TRAFFIC FROM A DEVICE ATTACHED TO THE PHONE.
- THE LINK BETWEEN THE SWITCH AND THE IP PHONE BEHAVES LIKE A TRUNK TO CARRY TRAFFIC FROM BOTH VLANS.

### VLAN RANGES ON CATALYST SWITCHES

- VLANs are split into two categories:
  - Normal range VLANs
    - VLAN numbers from 1 to 1,005
    - Configurations stored in the vlan.dat (in the flash memory)
    - IDs 1002 through 1005 are reserved for legacy Token Ring and Fiber Distributed Data Interface (FDDI) VLANs, automatically created and cannot be removed.
  - Extended Range VLANs
  - VLAN numbers from 1,006 to 4,096
  - Configurations stored in the running configuration (NVRAM)
  - VLAN Trunking Protocol (VTP) does not learn extended VLANs

 CISCO CATALYST 2960 AND 3560 SERIES SWITCHES SUPPORT OVER 4,000 VLANS.

```
Switch# show vlan brief
VLAN Name
                         Status
                                    Ports
     default
                                     Fa0/1, Fa0/2, Fa0/3, Fa0/4
                         active
                                     Fa0/5, Fa0/6, Fa0/7, Fa0/8
                                     Fa0/9, Fa0/10, Fa0/11, Fa0/12
                                     Fa0/13, Fa0/14, Fa0/15, Fa0/16
                                     Fa0/17, Fa0/18, Fa0/19, Fa0/20
                                     Fa0/21, Fa0/22, Fa0/23, Fa0/24
                                     Gi0/1, Gi0/2
1002 fddi-default
                         act/unsup
1003 token-ring-default act/unsup
1004 fddinet-default
                         act/unsup
1005 trnet-default
                         act/unsup
```

### **CREATING A VLAN**

Cisco Switch IOS Commands		
Enter global configuration mode.	Sl# configure terminal	
Create a VLAN with a valid id number.	S1(config)# <b>vlan</b> vlan-id	
Specify a unique name to identify the VLAN.	S1(config-vlan) # name vlan-name	
Return to the privileged EXEC mode.	S1(config-vlan)# end	

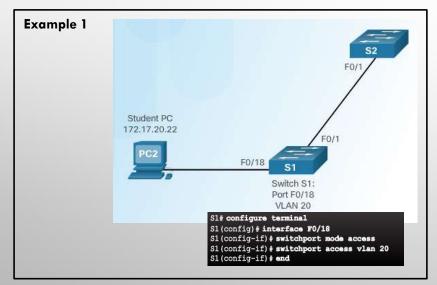

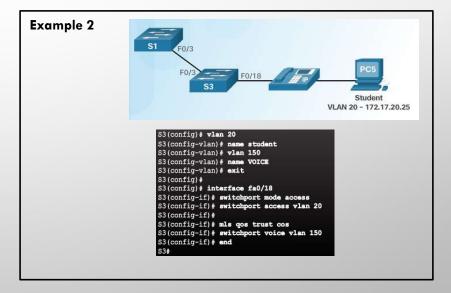

S1# configure terminal S1(config)# vlan 20 S1(config-vlan)# name student S1(config-vlan)# end

### **ASSIGNING PORTS TO VLANS**

Cisco Switch IOS Commands		
Enter global configuration mode.	Sl# configure terminal	
Enter interface configuration mode.	S1(config)# interface interface_id	
Set the port to access mode.	S1(config-if) # switchport mode access	
Assign the port to a VLAN.	S1(config-if) # switchport access vlan vlan_id	
Return to the privileged EXEC mode.	S1(config-if) # end	

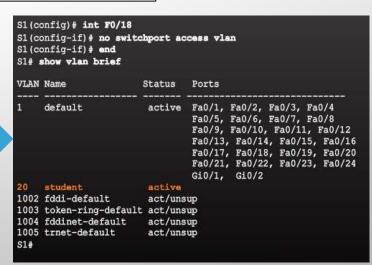

illiilli CISCO

### CHANGING VLAN PORT MEMBERSHIP

#### ■ REMOVE VLAN ASSIGNMENT

Cisco Switch IOS Commands		
Enter global configuration mode.	Sl# configure terminal	
Enter interface configuration mode	S1(config)# interface F0/18	
Remove the VLAN assignment from the port.	S1(config-if) # no switchport access vlan	
Return to the privileged EXEC mode.	S1(config-if)# end	

Even though interface F0/18 was previously assigned to VLAN 20, it reset to the default VLAN1.

### **DELETING VLANS**

■ USE THE **NO VLAN** VLAN-ID GLOBAL CONFIGURATION MODE COMMAND TO REMOVE VLAN.

```
S1# conf t
S1(config) # no vlan 20
S1(config)# end
S1#
S1# sh vlan brief
VLAN Name
                           Status
                                     Ports
                                     Fa0/1, Fa0/2, Fa0/3, Fa0/4
     default
                           active
                                     Fa0/5, Fa0/6, Fa0/7, Fa0/8
                                     Fa0/9, Fa0/10, Fa0/12, Fa0/13
                                     Fa0/14, Fa0/15, Fa0/16, Fa0/17
                                     Fa0/18, Fa0/19, Fa0/20, Fa0/21
                                     Fa0/22, Fa0/23, Fa0/24, Gi0/1
                                     G10/2
1002 fddi-default
                           act/unsup
1003 token-ring-default
                          act/unsup
1004 fddinet-default
                           act/unsup
1005 trnet-default
                           act/unsup
S1#
```

### VERIFYING VLAN INFORMATION

VLAN CONFIGURATIONS CAN BE VALIDATED USING THE CISCO IOS SHOW VLAN AND SHOW INTERFACES
COMMAND OPTIONS.

```
S1# show vlan name student
VLAN Name
                                     Status
20 student
                                     active
                                               Fa0/11, Fa0/18
VLAN Type SAID MTU Parent RingNo BridgeNo Stp BrdgMode Trans1 Trans2

Primary Secondary Type
                                   Ports
S1# show vlan summary
Number of existing VLANs
                                      : 7
Number of existing VTP VLANs
                                      : 7
Number of existing extended VLANS
S1#
```

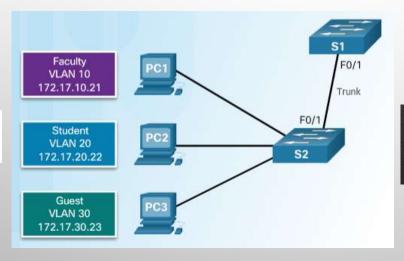

```
S1# show interfaces vlan 20
Vlan20 is up, line protocol is down
  Hardware is EtherSVI, address is 001c.57ec.0641 (bia 001c.57ec.0641)
  MTU 1500 bytes, BW 1000000 Kbit, DLY 10 usec,
    reliability 255/255, txload 1/255, rxload 1/255
  Encapsulation ARPA, loopback not set
  ARP type: ARPA, ARP Timeout 04:00:00
  Last input never, output never, output hang never
  Last clearing of "show interface" counters never
  Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 0
  Queueing strategy: fifo
  Output queue: 0/40 (size/max)
  5 minute input rate 0 bits/sec, 0 packets/sec
  5 minute output rate 0 bits/sec, 0 packets/sec
    O packets input, O bytes, O no buffer
    Received 0 broadcasts (0 IP multicast)
    0 runts, 0 giants, 0 throttles
    0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
    0 packets output, 0 bytes, 0 underruns
    0 output errors, 0 interface resets
    O output buffer failures, O output buffers swapped out
```

#### **VLAN TRUNKS**

### CONFIGURING IEEE 802.1Q TRUNK LINKS

Cisco Switch IOS Commands		
Enter global configuration mode.	S1# configure terminal	
Enter interface configuration mode.	S1(config) # interface Interface_id	
Force the link to be a trunk link.	S1(config-if)# switchport mode trunk	
Specify a native VLAN for untagged frames.	S1(config-if)# switchport trunk native vlan vlan_id	
Specify the list of VLANs to be allowed on the trunk link.	si(config-if)# switchport trunk allowed vlan vlan-list	
Return to the privileged EXEC mode.	S1(config-if)# end	

```
S1(config)# interface FastEthernet0/1
S1(config-if)# switchport mode trunk
S1(config-if)# switchport trunk native vlan 99
S1(config-if)# switchport trunk allowed vlan 10,20,30,99
S1(config-if)# end
```

cisco

Native VLAN

VLAN 99

172.17.99.0/24

#### **VLAN TRUNKS**

### RESETTING THE TRUNK TO DEFAULT STATE

Cisco Switch IOS Commands		
Enter global configuration mode.	S1# configure terminal	
Enter interface configuration mode.	S1(config) # interface interface_id	
Set trunk to allow all VLANs.	S1(config-if) # no switchport trunk allowed vlan	
Reset native VLAN to default.	S1(config-if) # no switchport trunk native vlan	
Return to the privileged EXEC mode.	S1(config-if)# end	

```
S1(config) # interface f0/1
S1(config-if) # no switchport trunk allowed vlan
S1(config-if) # no switchport trunk native vlan
S1(config-if) # end
S1# show interfaces f0/1 switchport
Name: Fa0/1
Switchport: Enabled
Administrative Mode: trunk
Operational Mode: trunk
Administrative Trunking Encapsulation: dotlq
Operational Trunking Encapsulation: dotlq
Negotiation of Trunking: On
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: enabled
<output omitted>
Administrative private-vlan trunk mappings: none
Operational private-vlan: none
 Trunking VLANs Enabled: ALL
Pruning VLANs Enabled: 2-1001
<output omitted>
```

F0/1 is configured as an access port which removes the trunk feature.

S1(config) # interface f0/1
S1(config-if) # switchport mode access
S1(config-if) # end
S1# show interfaces f0/1 switchport
Name: Fa0/1
Switchport: Enabled
Administrative Mode: static access
Operational Mode: static access
Administrative Trunking Encapsulation: dot1q
Operational Trunking Encapsulation: native
Negotiation of Trunking: Off
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: enabled
<output omitted>

#### **VLAN TRUNKS**

### VERIFYING TRUNK CONFIGURATION

```
S1(config) # interface f0/1
S1(config-if) # switchport mode trunk
S1(config-if) # switchport trunk native vlan 99
S1(config-if) # end
S1# show interfaces f0/1 switchport
Name: Fa0/1
Switchport: Enabled
Administrative Mode: trunk
Operational Mode: trunk
Administrative Trunking Encapsulation: dotlg
Operational Trunking Encapsulation: dotlq
Negotiation of Trunking: On
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 99 (VLAN0099)
Administrative Native VLAN tagging: enabled
Voice VLAN: none
Administrative private-vlan host-association: none
Administrative private-vlan mapping: none
Administrative private-vlan trunk native VLAN: none
Administrative private-vlan trunk Native VLAN tagging: enabled
Administrative private-vlan trunk encapsulation: dot1q
Administrative private-vlan trunk normal VLANs: none
Administrative private-vlan trunk associations: none
Administrative private-vlan trunk mappings: none
Operational private-vlan: none
Trunking VLANs Enabled: ALL
Pruning VLANs Enabled: 2-1001
<output omitted>
```

illiilli CISCO

# TROUBLESHOOT VLANS AND TRUNKS COMMON PROBLEMS WITH TRUNKS

- TRUNKING ISSUES ARE USUALLY ASSOCIATED WITH INCORRECT CONFIGURATIONS.
- THE MOST COMMON TYPE OF TRUNK CONFIGURATION ERRORS ARE:

Problem	Result	Example
Native VLAN Mismatches	Poses a security risk and creates unintended results.	For example, one port is defined as VLAN 99 and the other is defined as VLAN 100.
Trunk Mode Mismatches	Causes loss of network connectivity.	For example, one side of the trunk is configured as an access port.
Allowed VLANs on Trunks	Causes unexpected traffic or no traffic to be sent over the trunk.	The list of allowed VLANs does not support current VLAN trunking requirements.

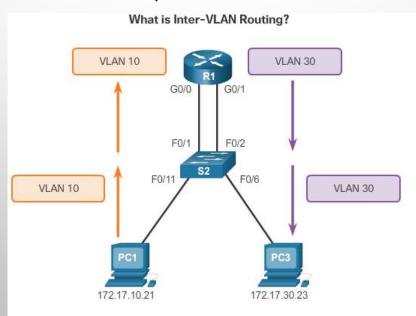

■ WHEN A TRUNK PROBLEM IS SUSPECTED, IT IS RECOMMENDED TO TROUBLESHOOT IN THE ORDER SHOWN ABOVE.

## INTER-VLAN ROUTING OPERATION WHAT IS INTER-VLAN ROUTING?

- LAYER 2 SWITCHES CANNOT FORWARD TRAFFIC BETWEEN VLANS WITHOUT THE ASSISTANCE OF A ROUTER.
- INTER-VLAN ROUTING IS A PROCESS FOR FORWARDING NETWORK TRAFFIC FROM ONE VLAN TO ANOTHER, USING A ROUTER.

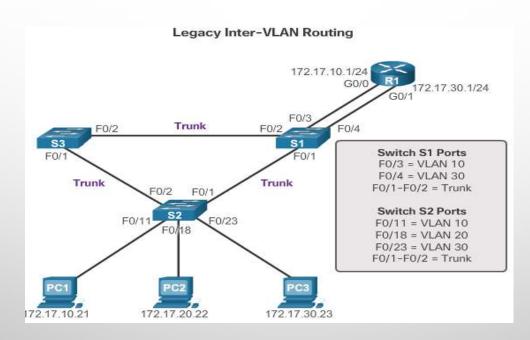

## INTER-VLAN ROUTING OPERATION LEGACY INTER-VLAN ROUTING

#### IN THE PAST:

- ACTUAL ROUTERS WERE USED TO ROUTE BETWEEN VLANS.
- EACH VLAN WAS CONNECTED TO A DIFFERENT PHYSICAL ROUTER INTERFACE.
- PACKETS WOULD ARRIVE ON THE ROUTER THROUGH ONE INTERFACE, BE ROUTED AND LEAVE THROUGH ANOTHER.
- BECAUSE THE ROUTER INTERFACES WERE CONNECTED TO VLANS AND HAD IP ADDRESSES FROM THAT SPECIFIC VLAN, ROUTING BETWEEN VLANS WAS ACHIEVED.
- LARGE NETWORKS WITH LARGE NUMBER OF VLANS REQUIRED MANY ROUTER INTERFACES.

# INTER-VLAN ROUTING OPERATION LEGACY INTER-VLAN ROUTING (CONT.)

In this example, the router was configured with two separate physical interfaces to interact with the different VLANs and perform the routing.

## INTER-VLAN ROUTING OPERATION ROUTER-ON-A-STICK INTER-VLAN ROUTING

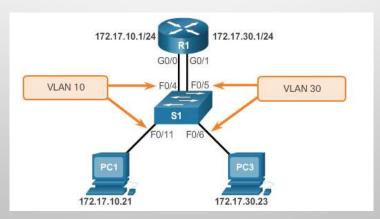

- THE ROUTER-ON-A-STICK APPROACH USES ONLY ONE OF THE ROUTER'S PHYSICAL INTERFACE.
- ONE OF THE ROUTER'S PHYSICAL INTERFACES IS CONFIGURED AS A 802.1Q
   TRUNK PORT SO IT CAN UNDERSTAND VLAN TAGS.
- LOGICAL SUBINTERFACES ARE CREATED; ONE SUBINTERFACE PER VLAN.
- EACH SUBINTERFACE IS CONFIGURED WITH AN IP ADDRESS FROM THE VLAN IT REPRESENTS.
- VLAN MEMBERS (HOSTS) ARE CONFIGURED TO USE THE SUBINTERFACE ADDRESS AS A DEFAULT GATEWAY.

#### CONFIGURE LEGACY INTER-VLAN ROUTING

# CONFIGURE LEGACY INTER-VLAN ROUTING: PREPARATION

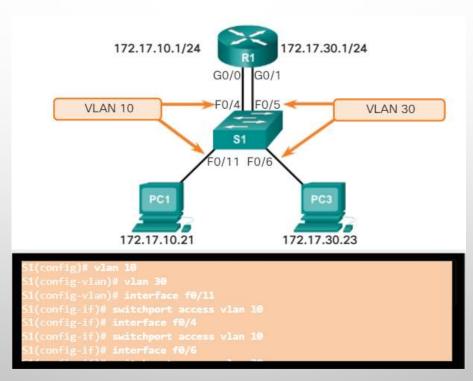

- LEGACY INTER-VLAN ROUTING REQUIRES ROUTERS TO HAVE MULTIPLE PHYSICAL INTERFACES.
- EACH ONE OF THE ROUTER'S PHYSICAL INTERFACES IS CONNECTED TO A UNIQUE VLAN.
- EACH INTERFACE IS ALSO CONFIGURED WITH AN IP ADDRESS FOR THE SUBNET ASSOCIATED WITH THE PARTICULAR VLAN.
- NETWORK DEVICES USE THE ROUTER AS A GATEWAY TO ACCESS THE DEVICES CONNECTED TO THE OTHER VLANS.

#### **CONFIGURE LEGACY INTER-VLAN ROUTING**

# CONFIGURE LEGACY INTER-VLAN ROUTING: SWITCH CONFIGURATION

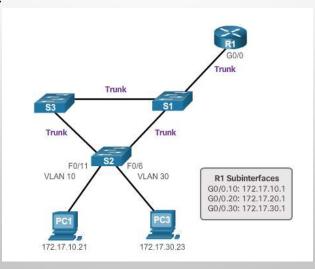

#### CONFIGURE LEGACY INTER-VLAN ROUTING

# CONFIGURE LEGACY INTER-VLAN ROUTING: ROUTER INTERFACE CONFIGURATION

```
R1 (config) # interface g0/0
R1 (config-if) # ip address 172.17.10.1 255.255.255.0
R1 (config-if) # no shutdown
*Mar 20 01:42:12.951: %LINK-3-UPDOWN: Interface GigabitEthernet0/0,
changed state to up

GigabitEthernet0/1, changed state to up
R1(config-if)# end
R1# copy running-config startup-config
```

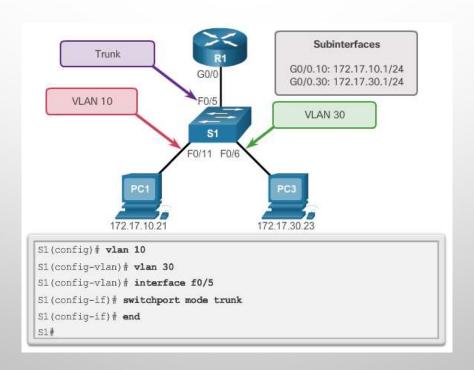

# CONFIGURE ROUTER-ON-A STICK: PREPARATION

- AN ALTERNATIVE TO LEGACY INTER-VLAN ROUTING IS TO USE VLAN TRUNKING AND SUBINTERFACES.
- VLAN TRUNKING ALLOWS A SINGLE PHYSICAL ROUTER INTERFACE TO ROUTE TRAFFIC FOR MULTIPLE VLANS.
- THE PHYSICAL INTERFACE OF THE ROUTER MUST BE CONNECTED TO A TRUNK LINK ON THE ADJACENT SWITCH.
- ON THE ROUTER, SUBINTERFACES ARE CREATED FOR EACH UNIQUE VLAN.
- EACH SUBINTERFACE IS ASSIGNED AN IP ADDRESS SPECIFIC TO ITS SUBNET OR VLAN AND IS ALSO CONFIGURED TO TAG FRAMES FOR THAT VLAN.

# CONFIGURE ROUTER-ON-A STICK: SWITCH CONFIGURATION

# CONFIGURE ROUTER-ON-A STICK: ROUTER SUBINTERFACE CONFIGURATION

```
